#1 HEADING - STUDIODB - OVERVIEW

⟨26⟩ Elements

VERSION: 1.1

StudioDB - is a screenwriting app designed to write screenplays for Movies and Series with a point of view of an artist.

Note - you can use it to write any thing you can imagine- For Example: I am using the App to write this User Guide

It lets you include Artists in your Project - attach Actors (Artist) to your Characters- and the image you select for the Actor will be associated with the character as you write and read your script.

=====

RAY
(thinking)
Hi

Now if Ray was casted with an Artist (Actor) - let's say John Doe - and John Doe had an image selected - then right above Ray his image would appear

=====

Every detail of the Script will be considered as an Object - you can view how each Character (object) is being used - read all the Scenes and Scripts the Character is attached to from the Project Tab (useful when it's a long Series or Saga you are writing)

Note - Characters and Locations are objects that exist inside a Project. In most cases they are fictional. Artists and Sites are real life objects that are used to make your Characters and Locations come to life.

Note - Artists and Sites exist outside of the Projects. They are attached to the Projects objects-like Characters and Locations. Each Artist and Site can exist in many Projects. But each Character and Location is unique to each Project.

Current version will let you import/export JSON files created by StudioDB

STUDIODB: MAIN TAB MENU

**Note - I am using Shot option - to create the headers
- if you were writing actual script - the above line
would look something like CLOSE UP: RAYS FACE**

1: STUDIO

2: PROJECTS

3: SCRIPTS

4: ARTISTS

5: SITES

6: XSCRIPT

7: CLIPBOARDS

8: READ

**Note - in Most cases - By Default - each screen/view
will also have an info button - that will describe
what you can do in that screen/view**

**Note - once you feel you don't need the info buttons -
you can turn off all info buttons from Studio -
Setting options**

**Note - Read contains all scripts created from external
source - as Read Only - Example - this User Guide,
StudioDB history and How to Guide Q&A**

#2 HEADING - STUDIO TAB

<60> Elements

STUDIO: FIRST TAB

Control your Studio, Projects , Saved content and Settings (Shot, Transitions and Genres)

STUDIO: SIDEBAR

1: HOME

2: PROJECTS

3: SAVED

4: SETTINGS

1 : HOME

Studio Home: Details, Contact Info and App Info

1 - Details - Starter View with your Studio Name, Studio Info, Studio Summary etc...

MENU : OPTIONS

- Edit Studio - Name, Short Name, Abbreviation
- Files Studio Report
- App Store

2 : PROJECTS

Control all your Project Groups, Project Deletions and Project Imports from here

Note - Project Deletes can only occur from here

Note - Project Import from JSON file can ONLY occur in the Default Project Group

Note - the import JSON file needs to exist in StudioDB App folder. But for backups you should move your JSON file outside of StudioDB folder.

Note - Default Project Group cannot be edited or deleted

MENU: OPTIONS

- Add Project
- Add Project Group
- Projects Files
- ProjectGroups files

SWIPE : ACTION ON PROJECT GROUP ROW

- Edit Project Group
- Add Project

PROJECT GROUP : DETAIL VIEW
